

Research report: « Billiards »

In tribute to
Myriam Mirzakhani

Step 2:
How can we represent the situation?

How can we finish it?

We will find this situation by making a rectangle then starting from a corner so that the ball bounces diagonal

Ahmad

- Experimentation:
- I can say if dimensions are L and $\frac{L}{2}$, so the area of the created rectangle are equals to $(\frac{L}{2})^2$
- And, if the rectangle has other sides, all squares are crossed.

Rayane

il ya 19 carré traversé pour les dimension 5 et 4
Conclusion: Je constate que ça peut formé des forme ect..

il ya 32 carré traversé pour les ~~dimension~~ dimension 8 et 8
Conclusion: je remarque que q'on peut la faire de tout les maniere

Omnya

Un billar mathématique est un système dynamique en el que una partícula alterna movimiento libre sobre una superficie y rebotes sobre una pared sin periodista de velocidad. El angulo rebote es idéntico al angulo de incidencia en el momento del impacto.

the mathematical problem

Constat:

On lance une bille dans une sorte de billard. On lance ^{une bille} à partir d'un sommet et qui rebondit sur les cotés. On ajoute 3 conditions:

- The billards can be divided into identical squares in a grid pattern
- We launch the ball according to the diagonal of a square from the grid (its trajectory always follows the diagonals of the grid)
- We make the assumption that that the trajectory ends if the ball reaches one of the tops of the rectangle

Steps

Tracks/aids

Skills

STEP 1:

FINDING

(mathematical hypothesis)

Describe what you seen
indicates the information collected

Detective-
Semiotic translator

Etape 2 : Les problèmes
Les questions

Combien de carré traverse la balle ? De quelle mesure doit être le rectangle ? Est-ce que ça peut être un carré ? Par quel côté commencé et est-ce que ça change quelque chose ?

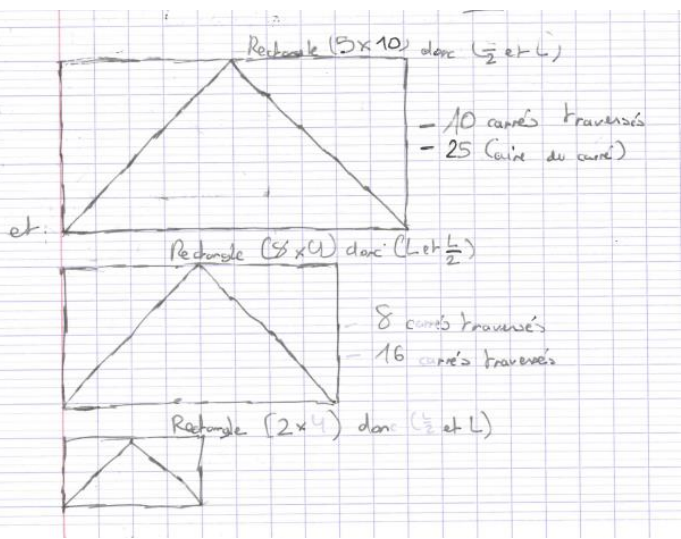

Rogette

STEP 2:
Questions and
problems

how to represent the situation ?
how can we find?
how can we demonstrate?
How calculate ?

Architect-
Mathematician

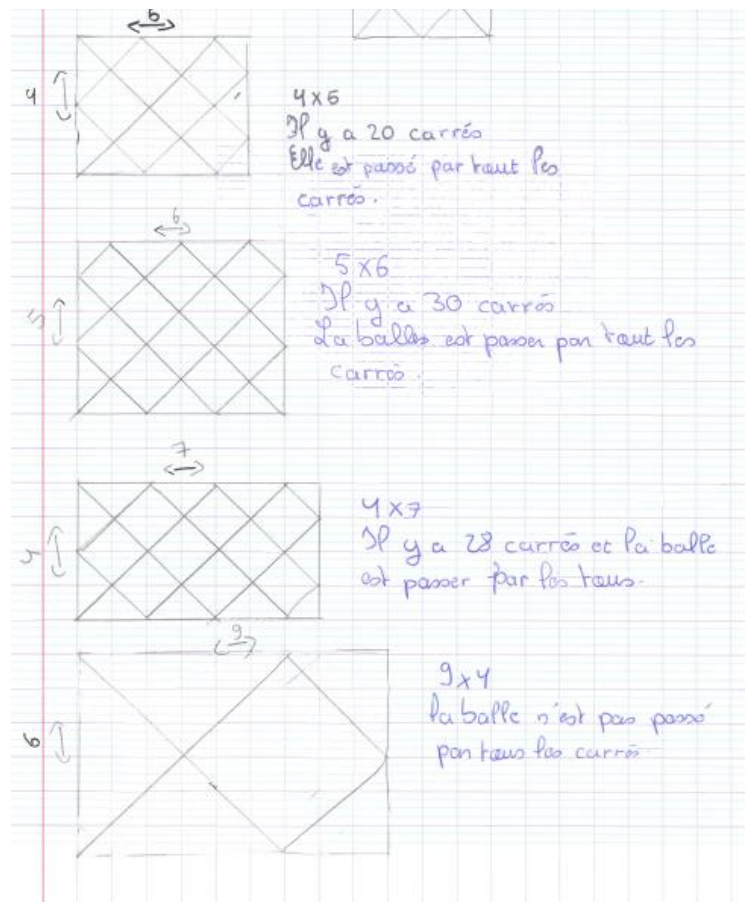

Rayane

3 par 3

passer par 3 carré?

Manel

Aminat

STEP 4:

Experimentation

You can use the calculator, build a graph, use a spreadsheet, use a geometry software or another. You can draw figures, use your geometry material, make cuts ... You can propose a method, a suitable calculation. You can recognize a theorem, a property, apply a formula.

Carpenter-
Controller- Semiotic
translator

Étape 2: Comment savoir si la table de billard peut-elle traversée avec des pongeurs différentes? Et si les chiffres et les nombres ont un rapport entre eux?

pour ces dimension 3 et 4 on traverse 3 carre je remarque que il ne faut pas faire 2x3

① Étape 4:

L	l	nombre de carreaux
3	2	6
4	3	12
5	2	10
5	3	15
5	4	20
6	3	18
7	3	21
7	5	35
7	6	42
8	2	16
9	3	27
9	4	36
9	6	54
10	5	50
10	6	60
11	6	66
11	10	110
12	7	84
13	6	78
15	8	120

②

L	l	nombre de carreaux
3	2	6
5	2	10
2	2	8
4	3	12
3	3	15
6	3	18
7	3	21
9	3	27
5	4	20
9	4	36
7	5	35
10	5	50
7	6	42
10	6	60
11	6	66
12	6	72
12	7	84
9	8	72
15	8	120
14	10	140

③

L	l	nombre de carreaux
3	2	6
5	3	15
8	2	16
2	3	6
5	2	10
10	5	50
4	3	12
5	3	15
5	4	20
7	3	21

7	5	35
9	4	36
7	6	42
11	6	66
9	8	72
13	6	78
12	7	84
11	10	110
15	8	120

Violetta

Clémence (ancienne élève 4^e)

STEP 4:

Experimentation

You can use the calculator, build a graph, use a spreadsheet, use a geometry software or another. You can draw figures, use your geometry material, make cuts ... You can propose a method, a suitable calculation. You can recognize a theorem, a property, apply a formula.

Carpenter-Controller- Semiotic translator

J'ai remarqué que si il y avait deux nombres paires la balle ne ^{traverse} pas la totalité des carrés. Alors que si on met deux nombres impaire en général la balle traverse tout les carrés sauf exception ^{comme} le rectangle 3 et 9 qui lui la balle ne passe que 9 cases au lieu de 27.

Et si l'on met un chiffre paire et un chiffre impaire, la balle traversera obligatoirement toutes les carrés dans chaque cas. Sauf peut-être le 10 et 5, mais dans les cas que j'ai trouvé la balle passe à chaque fois.

Le nombre traversé de carrés est le nombre total de carré dans le rectangle:

$10 \times 38 = 380$ nombre total
nombre de carrés traversés: 380

Alors le résultat est $380/380$ carrés traversés.

Nous avons le résultat de la trajectoire de la balle sur un terrain de 10 par 38: toutes les carrés ont été traversés.

Chris

Clémence (ancienne élève de 4^e)

Conjecture

If dimensions are L and $\frac{L}{2}$, so there are L squares crossed.

Yusra (ancienne élève de 4^e)

Rayane

STEP 3:
Conjectures

A conjecture is a possible solution, a reasonable guess. To solve a problem, you need to develop one or more conjectures. A conjecture may be the result of an experiment, so the step may precede step 3

Explorer-
Mathematician-
Librarian

ex. 4×3 .
 tout les carrés sont traversés
 $L \div l = 4 \div 3 = 1,3$ résultat
 décimal

départ arrivée

maintenant
 6×2 départ arrivée
 6 carrés / 2 sont traversés.
 $L \div l = 6 \div 2 = 3$ résultat entier

For know number of squares was crossed if the every squares wasn't crossed, we take the biggest longueur du square and we have the number of square crossed - ex:

$6 \times 2 =$ nombre entier. 6 est le plus grande longueur donc 6 carrés traversés

Etape 5 Résultat :

Nous pouvons trouver le nombre de carreaux que traverse la balle grâce aux dimensions de la grille.

- Si les dimensions de la grille possède que des nombres pairs : $\frac{m \times n}{2}$
- Si les dimensions de la grille possède un nombre pair et un nombre impair : $m \times n$
- Si les dimensions de la grille possède que des nombres impairs : $m \times n$

Rogette

Yanis (ancien élève de 4^e)

STEP 5:

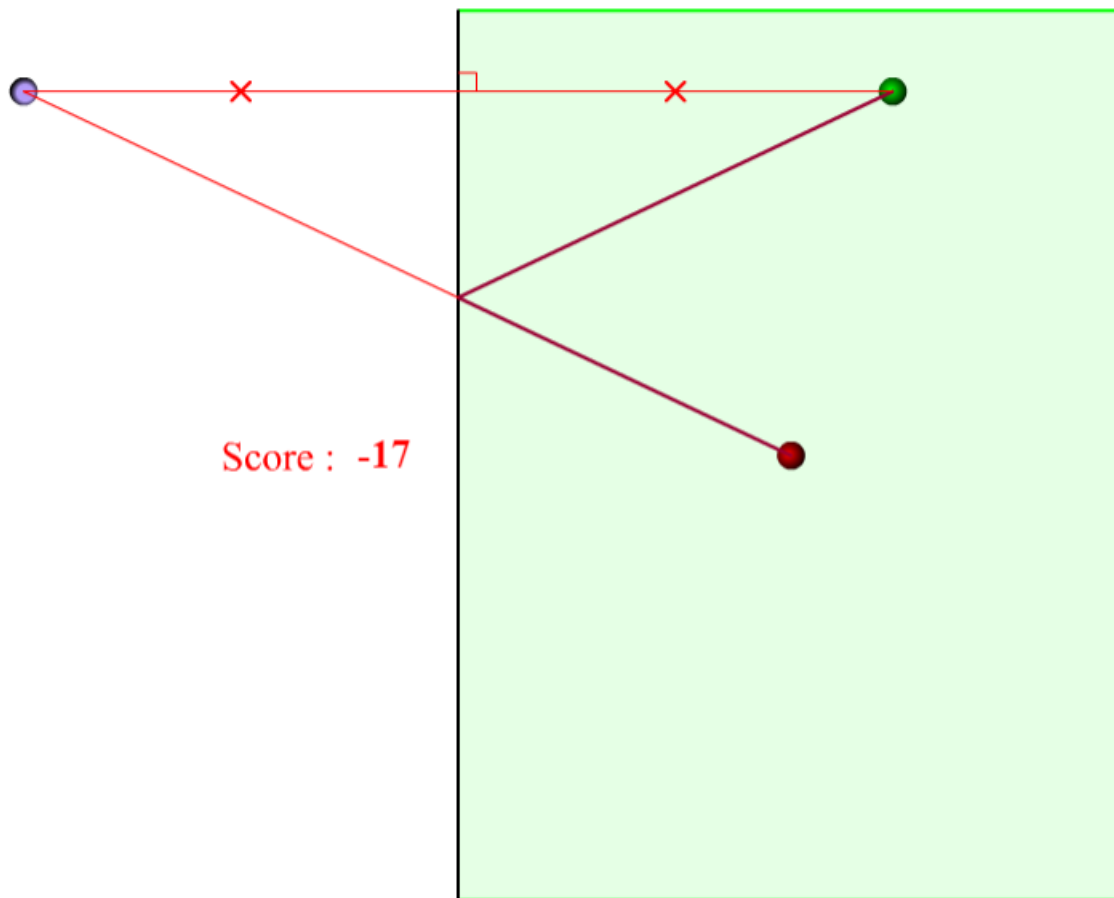

Results

Write a sentence in which you present your results and explain the sequence of your ideas. Does the result obtained during the experiment confirm the conjecture? Does the result of experimentation seem to you to be coherent?

Arbitrator-Conductor

Symétrie axiale : billard.

We could observe trajectories by symmetrical effect

<http://matoumatheux.ac-rennes.fr/geom/symetrie/6/billard.htm>

STEP 6:

Demonstration
Conclusion

You will implement reasoning. With your teacher, or alone, you will make a reasoning that will validate or invalidate your results. Then, it may follow a written or oral restitution of this demonstration

Mathematician

We could observe trajectories by symmetrical effect

<https://www.youtube.com/watch?v=eX5u2VOn9A4>

STEP 6:

Demonstration Conclusion

You will implement reasoning. With your teacher, or alone, you will make a reasoning that will validate or invalidate your results. Then, it may follow a written or oral restitution of this demonstration

Mathematician

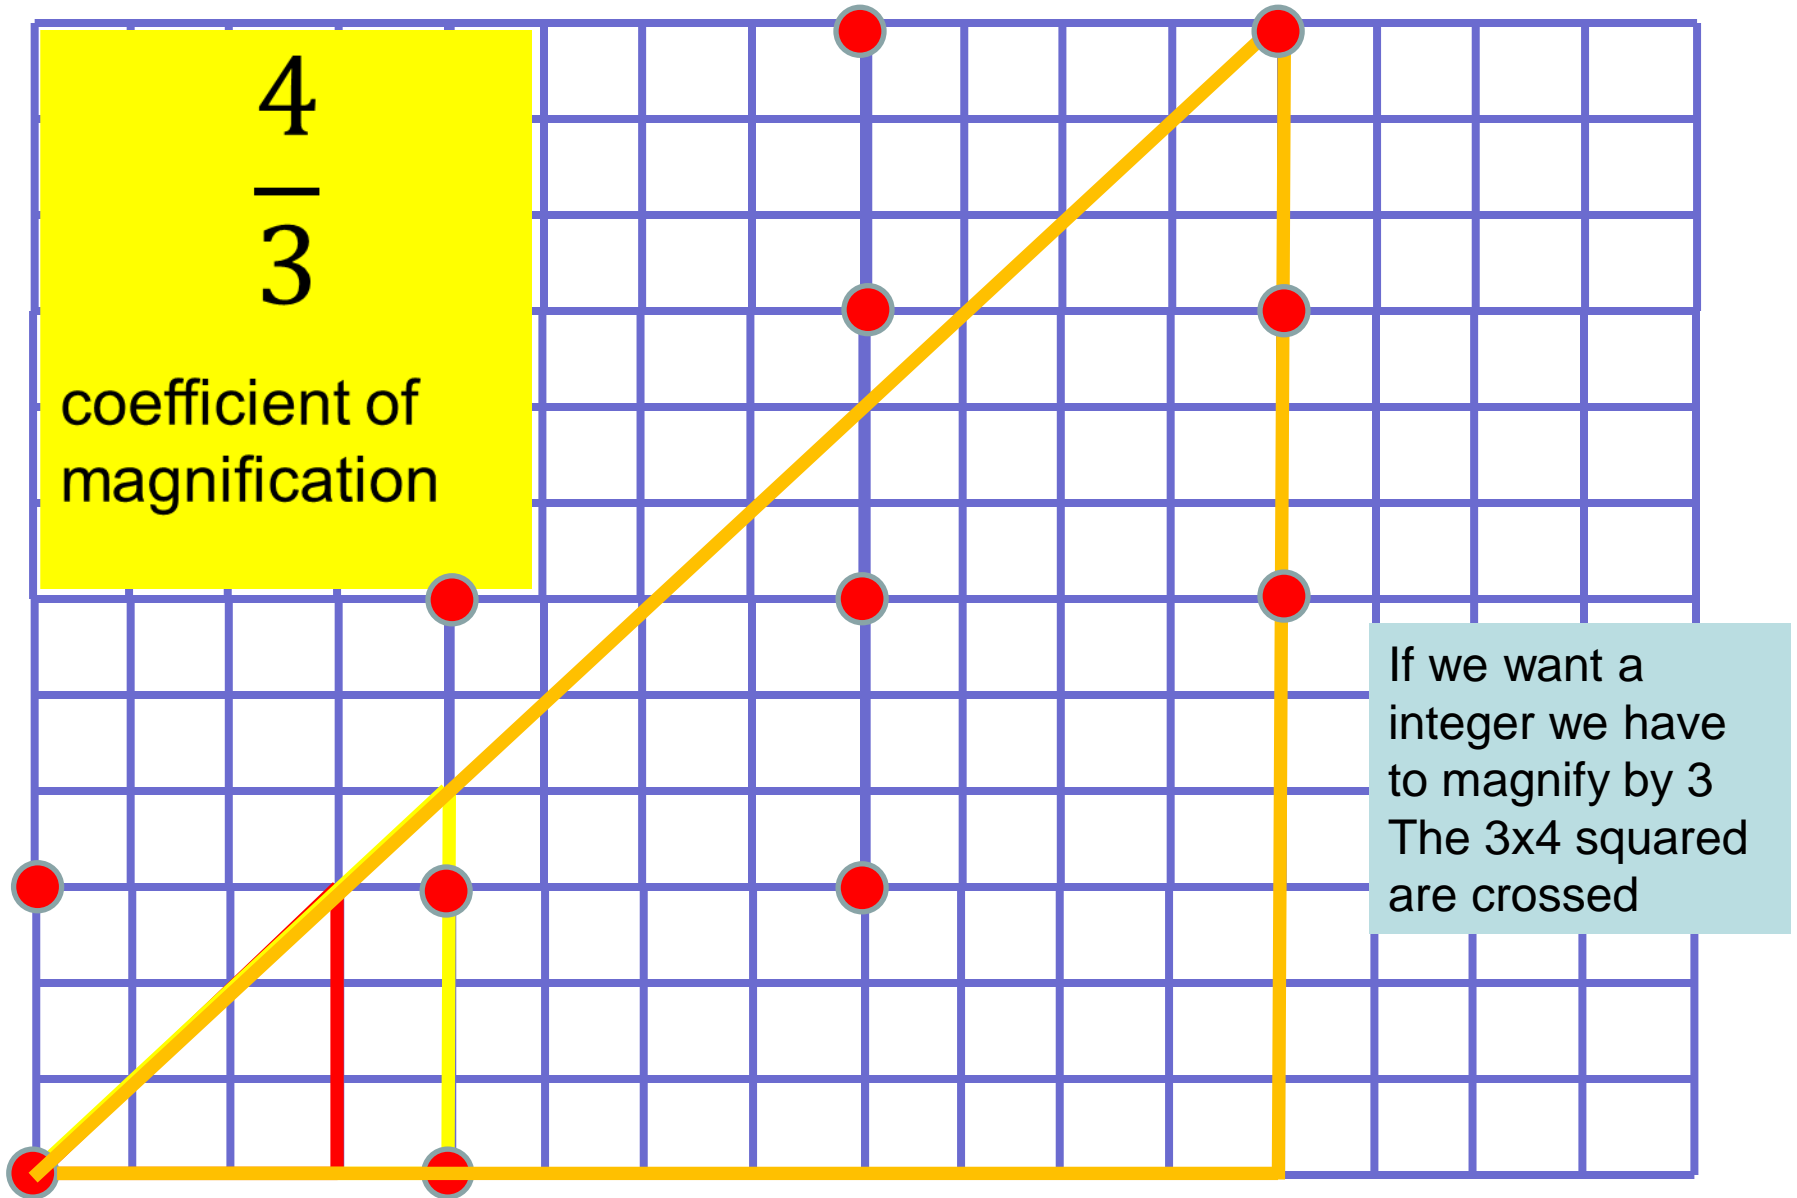

départ

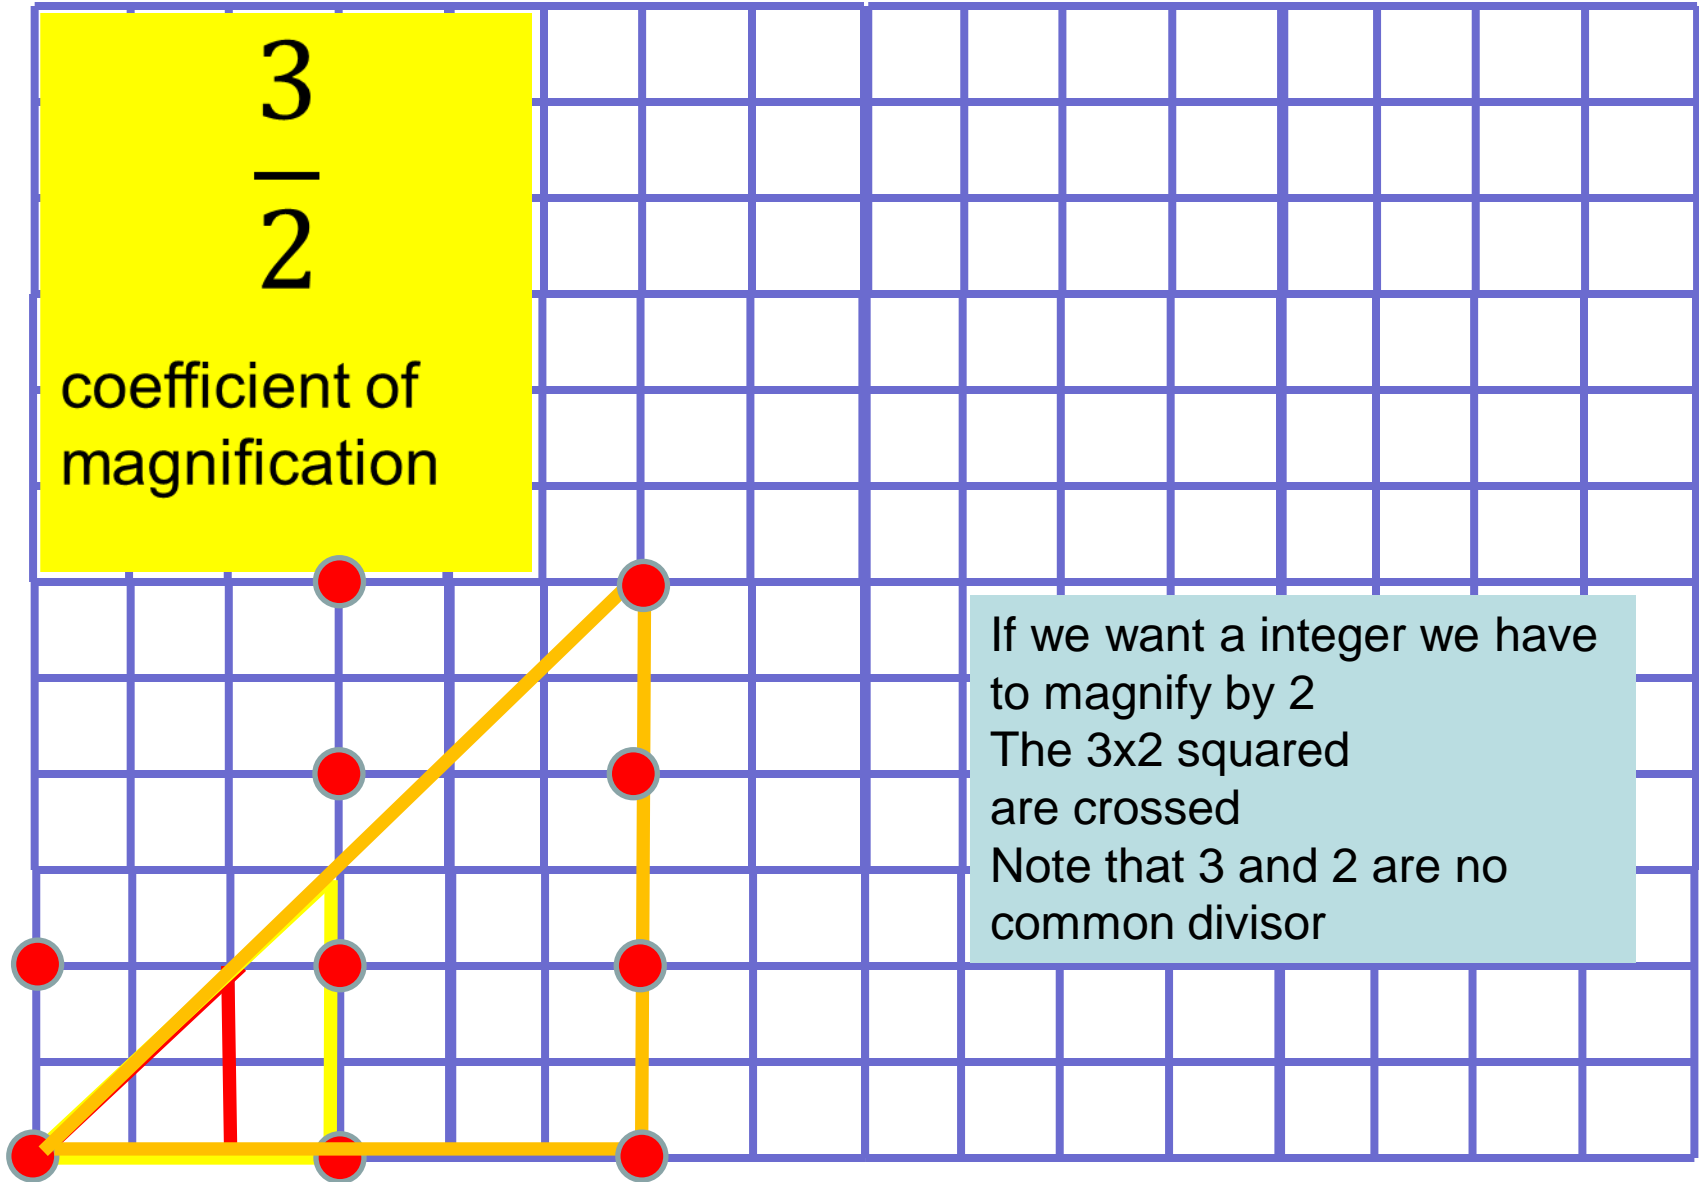

In our problem ?

Could you recognize Thales theorem ?

If we change the dimensions of the rectangle ?

If Length and width have common divisor ?

Try your own length and width !
